

# High Resolution Site Characterization – HPT Groundwater Sampling System

Running HPT logs in the Platte River alluvial aquifer, Clarks, NE.

Daniel Caputo  
([dcaputo@vironex.com](mailto:dcaputo@vironex.com))

# Vironex, Inc.

Core Services - Driller → Injection → HRSC → Search & Destroy™

- Direct Push

- Sampling (Groundwater, Soil, Vapor)
- Well Installation (Pre-pack and Auger)

- Advanced Site Characterization

- HRSC Probes targeting hydro/lithologic properties
- HRSC systems for highly resolved contaminant profiling
- HRSC 3D Modeling

- Injection/Remediation Services

- Chemically Compatible Equipment to Inject all ISCO, ISCR and Bioremediation Amendments
- Experience in all Lithologies (including Bedrock)
- In Situ Mixing
- Extraction/Injection Systems

# Presentation Outline

- HPT Principles of Operation
- Equipment Needed and Logging Technique
- Interpreting an HPT log
- HPT Log Cross Section and Hydrostratigraphy
- Dissipation Tests ... How and Why?
- Estimating Hydraulic Conductivity (K) with Q &  $P_c$
- HPT-GW Sampler

# HPT Principles of Operation

**Inject Water at  
300 ml/min**

**Advance Probe at  
2 cm/sec**

**It takes about 1.5  
hours to run a 60 ft  
(20 m) log & trip out**

- A) Water Tank
- B) Pump & Flow Meter
- C) Electronics/computer
- D) Trunkline
- E) Pressure Sensor
- F) Screened Injection Port
- G) Elec. Conductivity Array

--- Water Flow Lines

# How Much Injection Flow ?

**300 ml/min**

**= ? ml/sec**

**How much per log?**

# How Much Injection Flow ?

$$300 \text{ ml/min} \times 1 \text{ min}/60 \text{ sec}$$

$$= 5 \text{ ml/sec}$$

Advance probe at 2 cm/sec

So Inject 5 ml over 2 cm

~ 75 ml/ft of log

Reality ~ 5 gal (20 l) for 60ft log

# Example HPT Log

*Data Users can use DI Viewer Software to open single HPT logs, cross sections of logs, etc.*

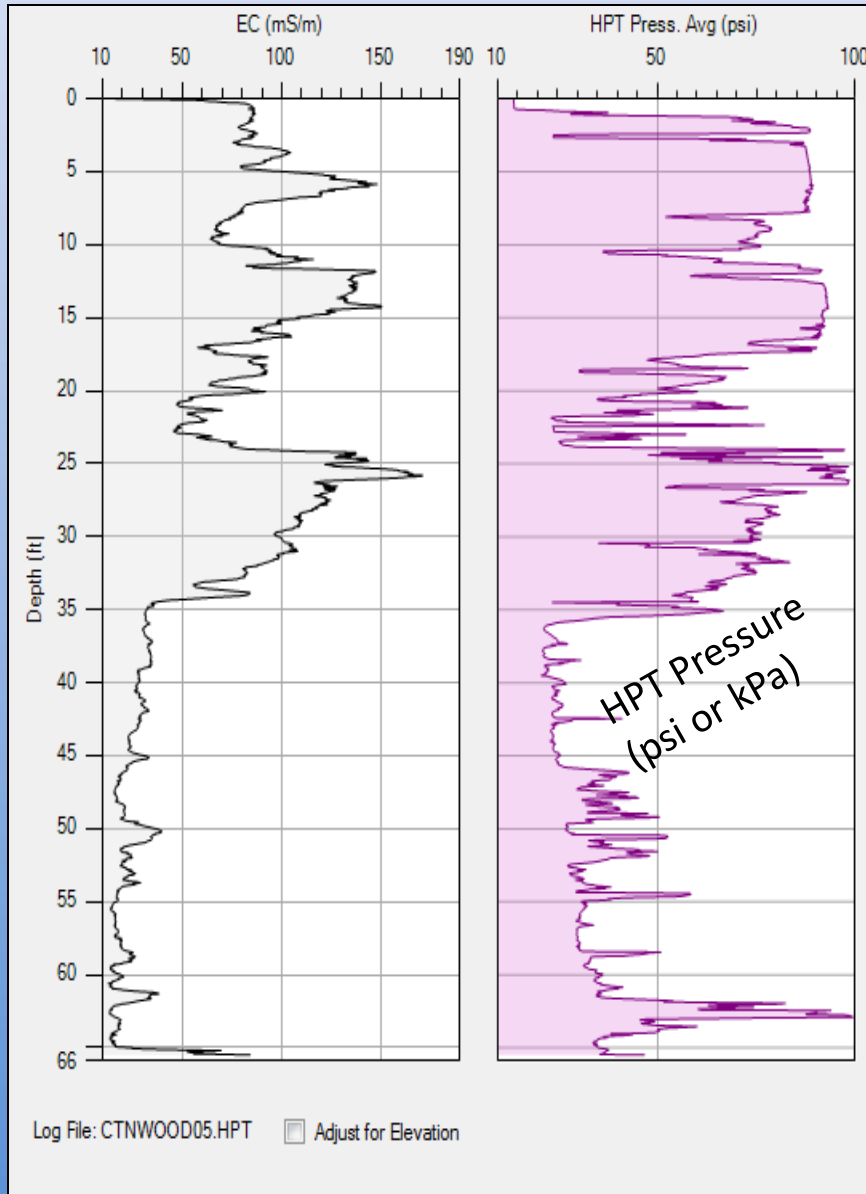

The screenshot shows the Geoprobe Systems website. The header includes the company logo, a phone number (800-436-7762), a search bar, and a 'Translate' button. The navigation menu has 'HOME', 'PRODUCTS', 'SUPPORT', and 'CONTACT US'. The main content area features the title 'Direct Image Viewer 1.6' with a version information bar: 'Version: 1.6 | Build: 13031 | Release Date: Fri, 02/01/2013 | File Size: 2.58 MB'. A prominent orange button says 'Click to Download: Direct Image Viewer 1.6'. Below this is a section titled 'What is Geoprobe® Direct Image® Viewer?' with three bullet points: 'Automatically opens and displays all types of Geoprobe®-DI Logs including EC, HPT, MIP, MIHpt, and HPT-GW.', 'Used by field operators to QC finish logs in the field.', and 'Used by consultants, regulators, and site owners to compare logs and develop site models.' On the right side, a list of supported log types is shown under the heading 'Direct Image®': EC, MIP, LL MIP, MIHpt, HPT, HPT-GWS, CPT, and PST.

The DI Viewer software is available as a free download at:  
<http://geoprobe.com/downloads/direct-image-viewer-16>

# A Basic HPT Log & Interpretation

# Basic Interpretation Rules

## HPT Pressure (all formations)

- Increasing P = decreasing permeability
- Decreasing P = increasing permeability

# Basic Interpretation Rules

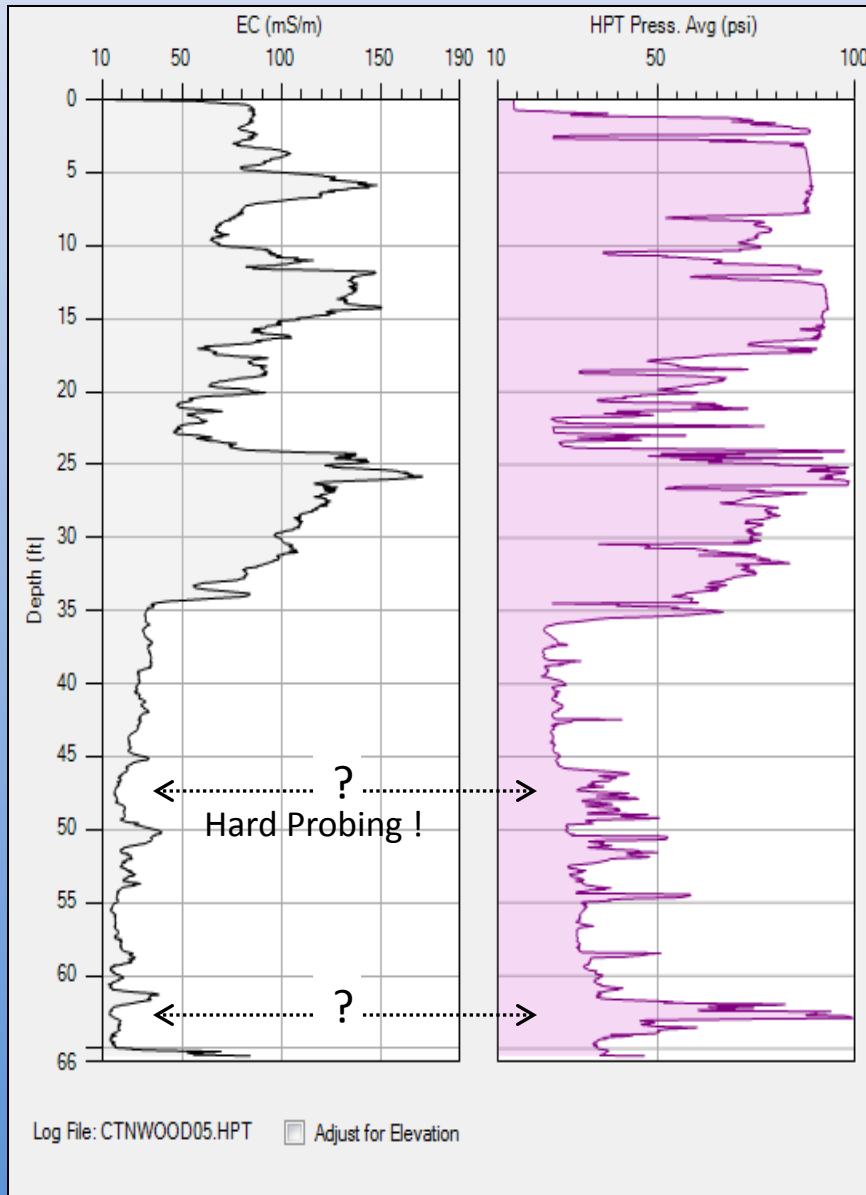

## Electrical Conductivity (EC) *(in fresh water formations)*

- Increasing EC = increasing clay content  
= lower permeability
- lower EC = coarser grained  
= higher permeability

# Basic Interpretation Rules

## Electrical Conductivity (EC)

- *Exceptions !*
- *Low EC but High Pressure*
  - Silts & cementing
  - Not all clays = high EC
- High EC can exhibit low HPT pressure
  - Seawater
  - Oilfield brine
  - Ionic remediation fluids  
(ionic compounds)

} = high EC

# Hydrostatic Pressure, Dissipation Tests, Water Levels & More

**Dissipation Tests** allow for the applied pressure to the formation to dissipate to equilibrium

## **Dissipation Tests Needed to Determine:**

- Water Level
- Hydrostatic Pressure
- Corrected HPT Pressure
- Est. Hydraulic Conductivity

## **Hydrostatic Pressure:**

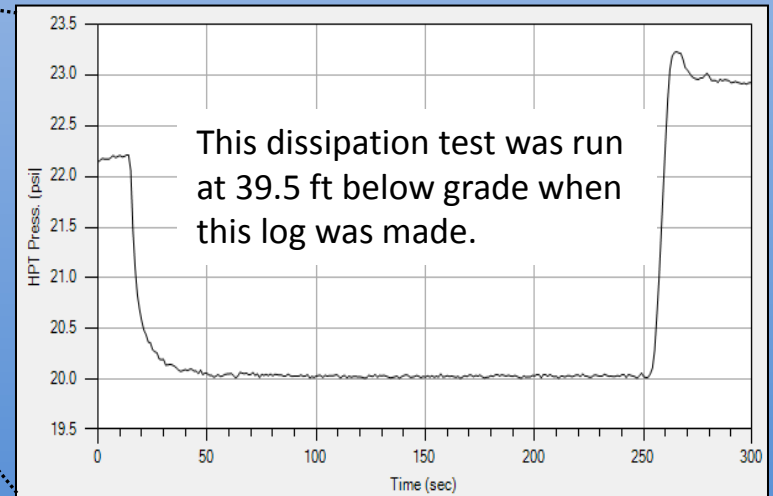

- 2.31 ft of water = 1 psi
- 0.433 psi/ft water

# Hydrostatic Pressure, Dissipation Tests, Water Levels & More

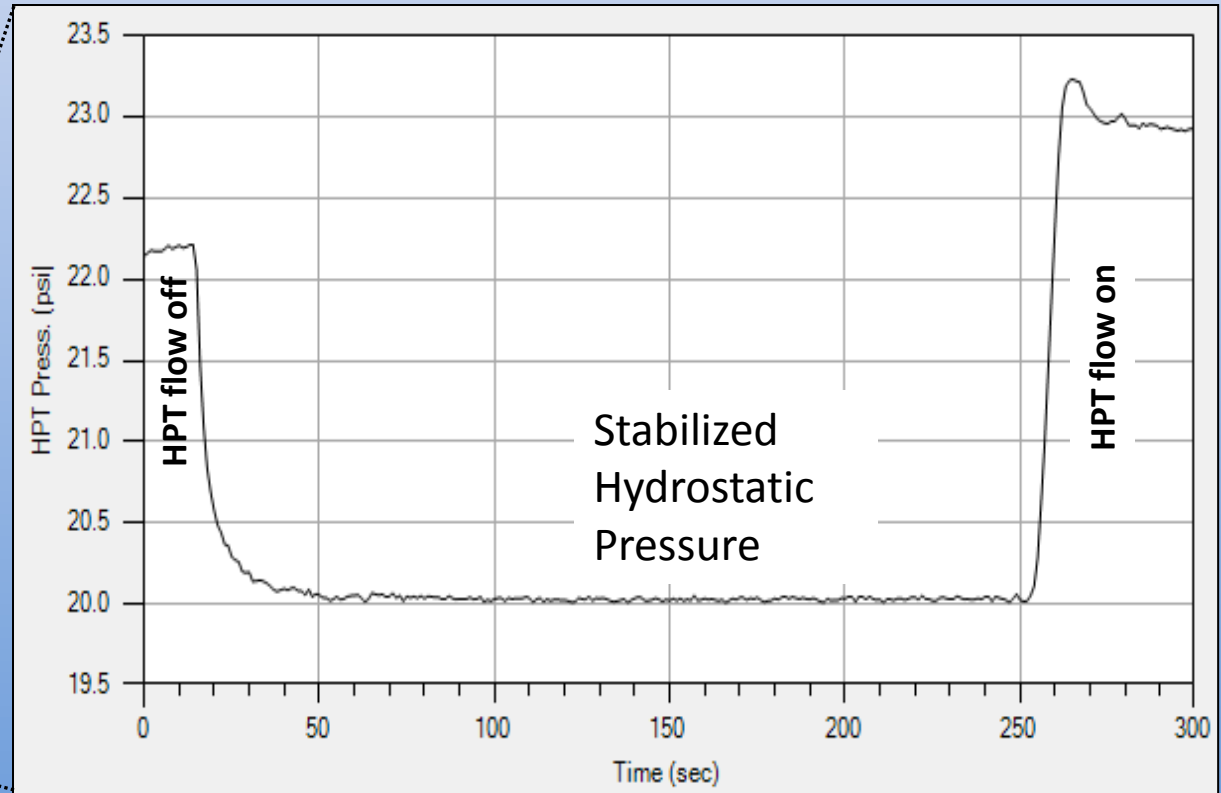

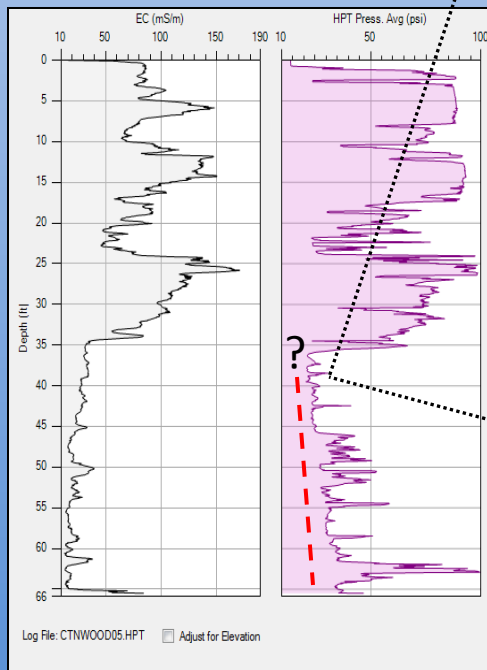

Pressure **Dissipation Tests** yield absolute hydrostatic pressure below the water table.

Prefer to run dissipation tests in sandy zones.

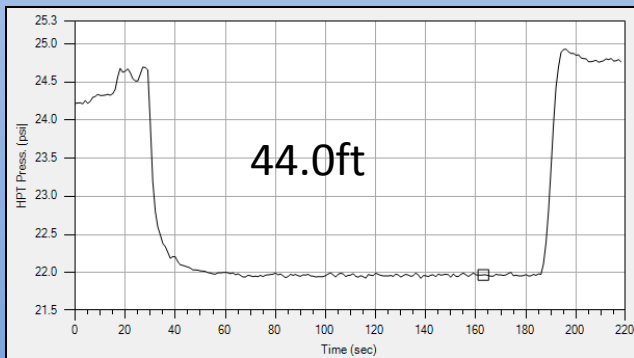

# To Run a Dissipation Test ...

- Stop Probe Advancement
- Turn off HPT flow
- Record pressure changes in a time file

This dissipation test was run at 39.5 ft below grade when this log was made.

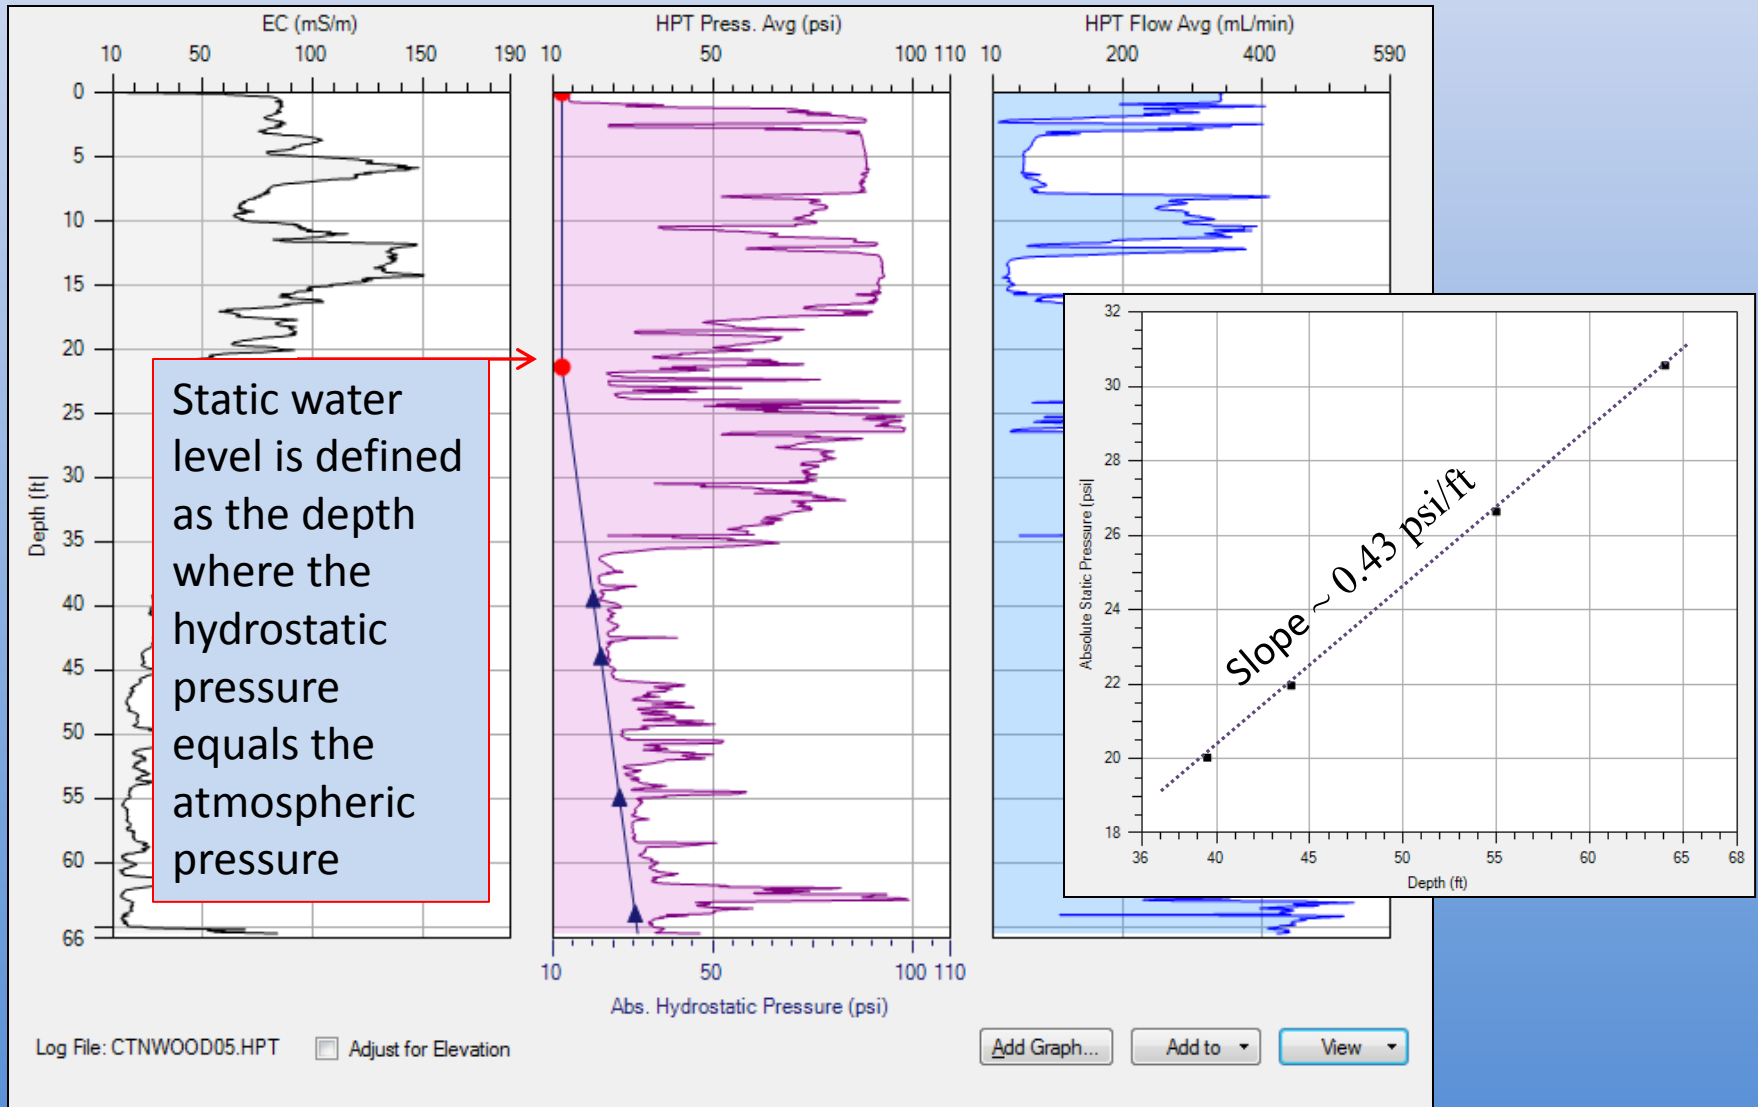

# Is Slope of the Hydrostatic Pressure Line Correct?

$$\frac{21.971 - 20.036 \text{ psi}}{44.0 - 39.5 \text{ ft}} = \frac{1.935 \text{ psi}}{4.5 \text{ ft}} = 0.430 \text{ psi/ft} = \text{hydrostatic pressure slope}$$

(for a water table aquifer)

# Fully Dissipated Tests = Good Hydrostatic Pressure Line and Water level

# Corrected HPT Pressure

At each depth increment:

Corrected HPT Pressure ( $P_c$ ) =

Total HPT Pressure - (Atm. Press. + Hydro. Press)

# Corrected HPT Pressure

At each depth increment:  $\text{Corrected HPT Pressure} = \text{Total HPT Pressure} - (\text{Atm. Pressure} + \text{Hydrostatic Pressure})$

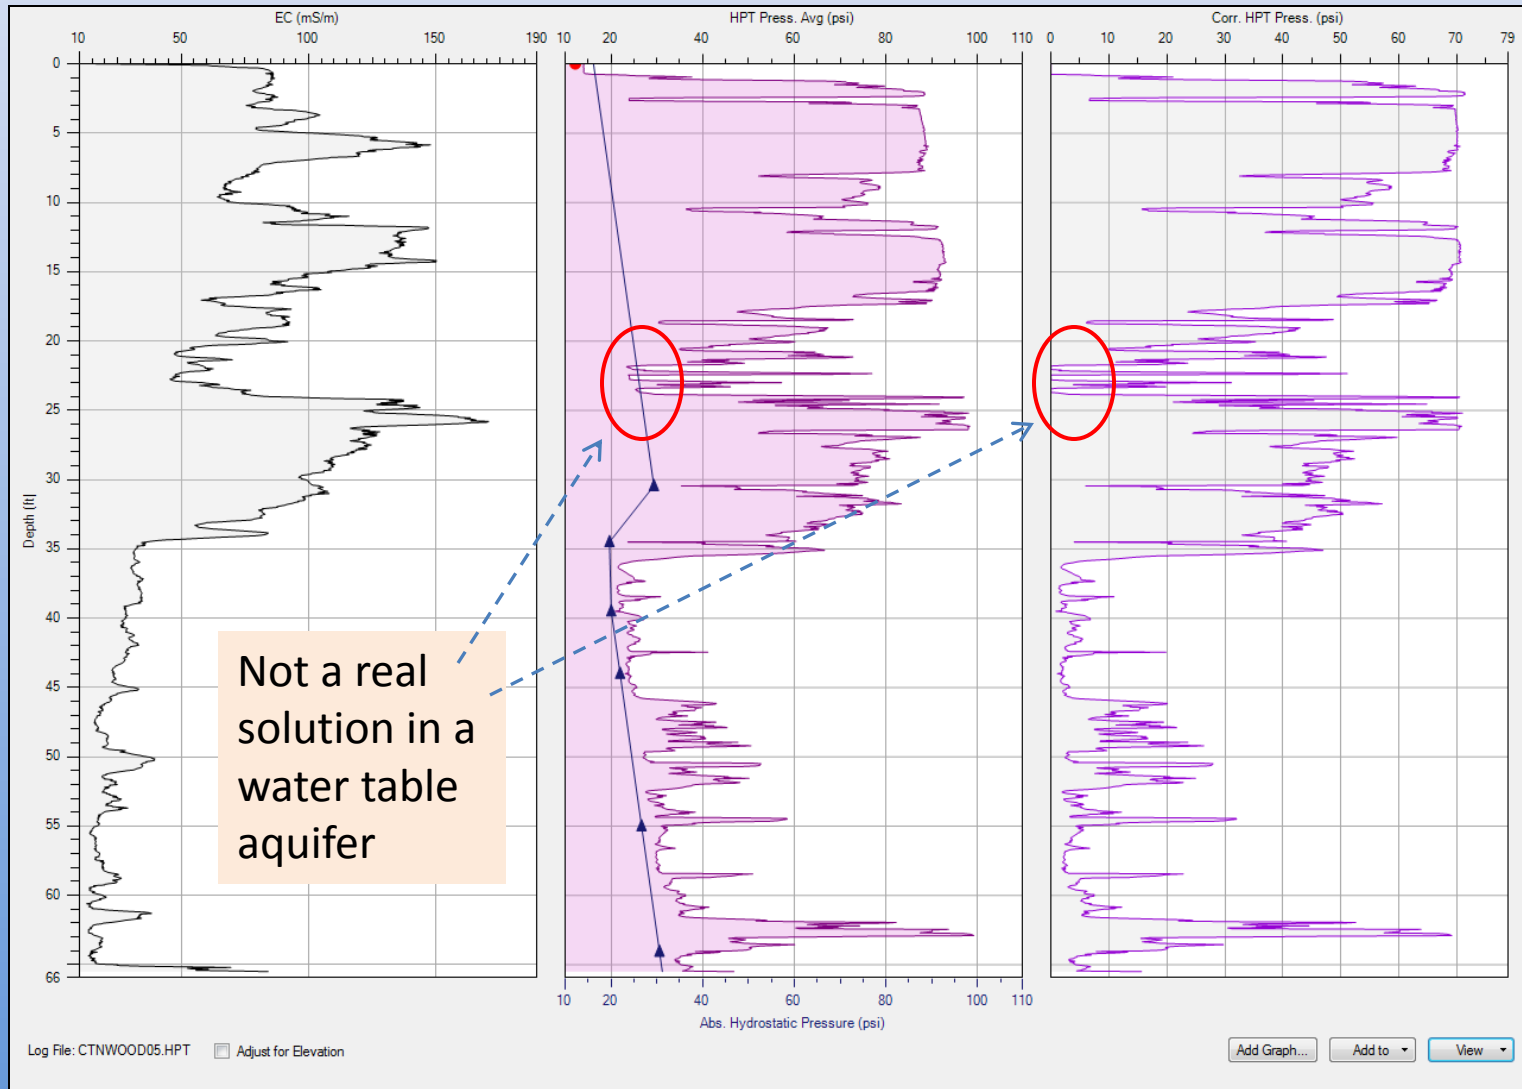

# Is Your Dissipation Test Fully Dissipated ?

Examples of  
Unsuccessful  
Dissipation  
Tests

# Incomplete Dissipation Tests ...

... result in incorrect hydrostatic pressure lines (slope), incorrect static water levels and incorrect corrected pressure graphs ...

# Estimating Hydraulic Conductivity (K) with HPT Log Data

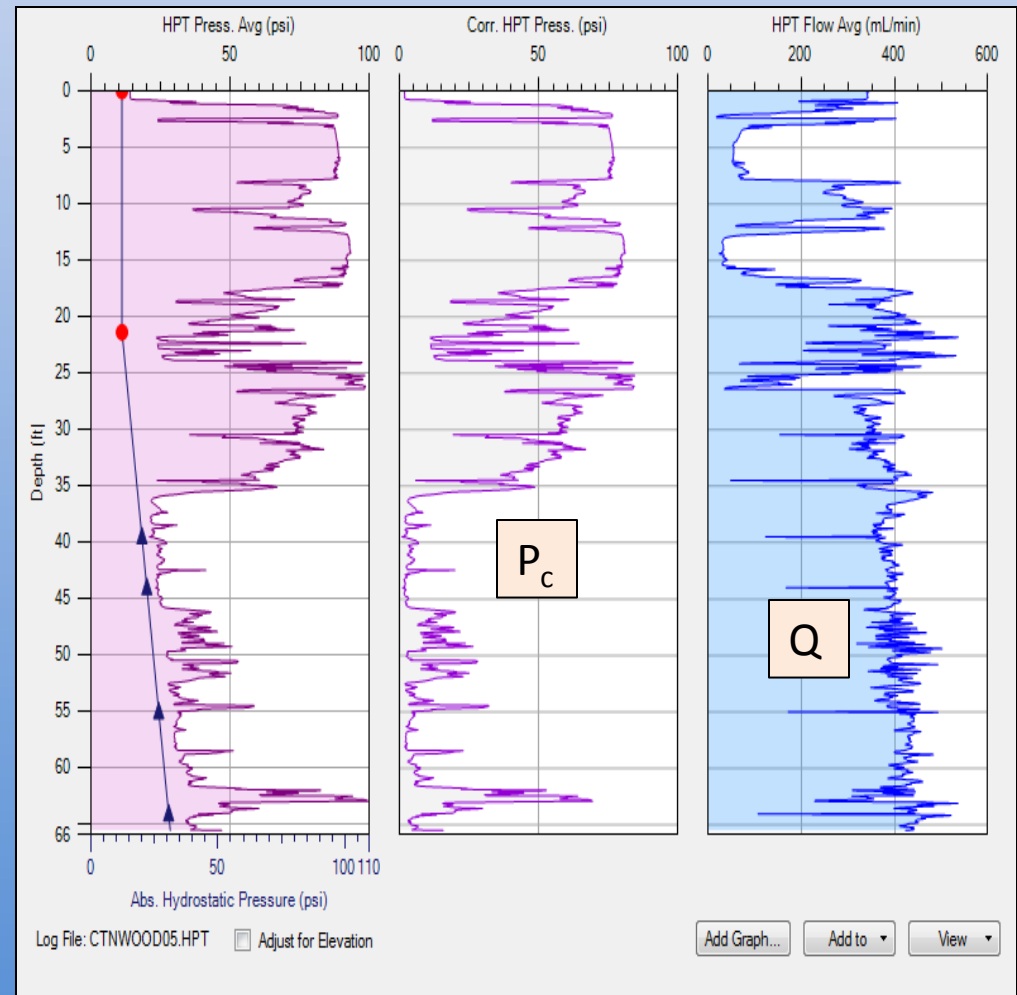

From Darcy's Law:

Hydraulic Conductivity (K) = f(Q/P)

HPT logs provide both:

Corrected Pressure ( $P_c$ )

And Flow Rate (Q)

# Estimating K with HPT Q and $P_c$ Data

Empirical Model developed from co-located slug tests and HPT logs to calculate K from  $Q/P_c$  ratio.

Study area next to cottonwood tree

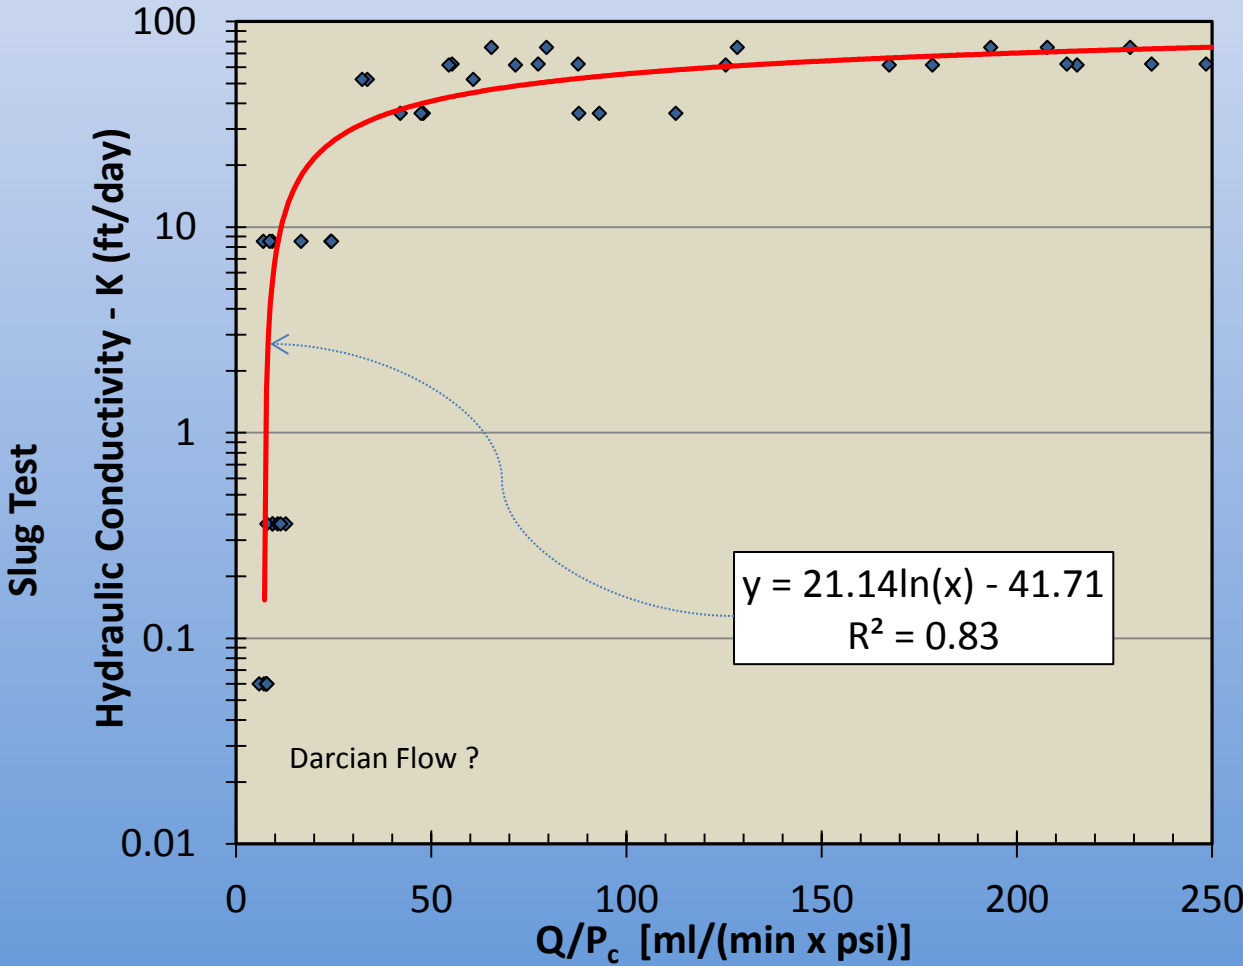

Performing a Pneumatic Slug Test

# Multi-Level Discrete Interval Slug Tests

$$K = f(Q/P_c)$$

# Empirical Model for Estimating K with HPT Q & P<sub>c</sub>

## Model Limits

~ 0.1 ft/day to  
75 ft/day

or

3.5E-5 cm/sec to  
2.6E-2cm/sec

# Estimated K with the DI Viewer Software

# HPT – Groundwater Sampler

- Same principal of operation as HPT
- Increased Flow to 400 mL/min
- 4 injection ports
- Produces an HPT log similar to the standard tool
- The system is connected to pump/tubing for sample collection
- Bladder or Peristaltic Pumps are used for sampling.

# HPT-GWS Log

Maxton, North  
Carolina

Sample collected at  
each black triangle

# HPT – Groundwater Sampler

## Benefits

- Collect a large data set in one push – lithology (EC), permeability (HPT), and analytical data (sampler)
- Collect groundwater samples at multiple depths in one push
- HPT pressure and EC data can be utilized to select sampling intervals
- Samples collected from precise intervals – about 4 inches

# HPT – Groundwater Sampler Limitations

- Larger Tool – 2.25” tool and rod may limit depth over the standard 1.75” tooling
- Samples must be collected from permeable zones
- Decontamination limitations
- 2x the time per boring as standard HPT (dependent on # of samples and sampling procedures)

MIP and  
HPT or  
MiHPT

# Summary

- HPT Principles of Operation
- Equipment Required for Logging
- Basics of HPT Log Interpretation
- Making a Cross Section with HPT Logs
- Interpreting Hydrostratigraphy with HPT

# Summary

- Dissipation Tests, Hydrostatic Pressure & Water Levels
- Correcting HPT Pressure ( $P_c$ )
- Estimating Hydraulic Conductivity from  $P_c$  and  $Q$
- HPT- GWS Tool Uses and Limitations
- MiHPT
